

The Standard Overhead Join

See and be seen
Always look out

Sequence safely with existing circuit traffic.

Position to cross within the upwind threshold at circuit height.

Descend to circuit height on the non-traffic side.

Call downwind

Call, "Overhead, joining for runway ..."

Circle overhead until you have established the circuit direction based on wind and traffic. Then make all turns in the circuit direction.

Maintain 500 ft above circuit height, keeping the aerodrome a suitable distance on the left. Look for other traffic and note the wind direction.

First radio call should be made 5 to 10 miles from the aerodrome.
